2 - Introduction

2.1 - Document purpose

This document outlines the technical details for the OC Pizza Information Management system.

This document provides the technical details used in developing the OC Pizza Company Information Management System Application.

The elements of document include:

- Technical Architecture
- Roll out details
- Software Architecture Details
- Project Specifics

2.2 - References

For further information, please refer also to the following elements:

- 1. FDF 1: Functional design for the application
- 2. OF 1: Operational File
- 3. DN 1: Delivery Note File

3 - TECHNICAL ARCHITECTURE

3.1 - General components

3.1.1 - Apache Tomcat HTTP Server

Web server for users to serve HTML documents in a web browser including the OC Pizza main web page, information about OC Pizza company, and order pizza and check order status. In addition, Client management will have their own site served for managing company operations.

3.1.2 - JBOSS Application Server

The application server contains the business logic for running the website and interfacing with the database server to store and retrieve client information, such as employee information, stock status, pizza recipes, customer information such as name, address, contact, past orders, and current order and status is any. Accounting information will be kept separate. This will be run on an independent server (ie, not shared with Database server).

3.1.3 - Push Notification Solution for Mobile Platforms

Typically use Android/iOS frameworks for push notifications and use Uniqush for internal notifications via web management page.

3.1.4 - MySQL 8 - Database Server

MySQL will be used as the database system. Management of the database will use MySQL workbench. The database will be run on an independent server.

A UML Component Diagram of the general components is indicated in Figure 1.

Figure 1 - UML component Diagram

3.2 - Web Site

The software stack is as follows:

- Client App/User App (Android, iOS)
- HTML/CSS/Javascript Webpage implementation
- Apache Tomcat Webserver / JBoss application Server
- MvSQL Database

SB Designs 1 Main Street
www.sbdesigns.io LLC Page 5 of 69

3.3 - Mobile Applications

3.3.1 - Android Application

The OC Pizza Company application will run on devices running Android v8 and above. Apps are written using Android Studio IDE using Kotlin. Standard frameworks are used with no external dependencies.

3.3.2 - iOS and iPadOS Application

The OC Pizza Company application will run on devices running iOS/iPadOS version 12 and above. Apps are written XCode IDE using Swift. Standard frameworks are used with no external dependencies (no Swift packages or 'CocoaPods').

SB Designs 1 Main Street
www.sbdesigns.io LLC Page 6 of 69

4 - ROLL-OUT ARCHITECTURE

The roll out architecture diagram is shown in Figure 2. White items are devices which run the backend software, while green (customer) and blue (client) are devices running the front end which communicate with the backend. Others are devices to be included in the roll out of the OC Pizza Company IT system.

Figure 2 - UML Roll-out diagram

4.1 - Database (MySQL) Server

After downloading the MySQL Installer for the first time, a setup wizard guides you through the initial installation of MySQL products. The initial setup is a one-time activity in the overall process. MySQL Installer detects existing MySQL products installed on the host during its initial setup and adds them to the list of products to be managed.

During the initial setup, you are prompted to select the MySQL products to be installed on the host. One alternative is to use a predetermined setup type that matches your setup requirements. By default, both GA and pre-release products are included in the download and installation with the **Developer Default**, **Client only**, and **Full** setup types. Select the **Only install GA products** option to restrict the product set to include GA products only when using these setup types.

Choosing one of the following setup types determines the initial installation only and does not limit your ability to install or update MySQL products for later:

- **Developer Default**: Installs a full suite of applications, examples, and documentation suitable for application development with MySQL. It is recommended to use this upon first run setup:
- Server only: Only install the MySQL server. This setup type installs the general availability (GA) or development release server that you selected when you downloaded MySQL Installer. It uses the default installation and data paths.
- *Client only*: Only install the most recent MySQL applications and MySQL connectors. This setup type is similar to the Developer Default type, except that it does not include MySQL server, or the client programs typically bundled with the server, such as MySQL or mysqladmin.
- Full: Install all available MySQL products.
- **Custom**: The custom setup type enables you to filter and select individual MySQL products from the MySQL Installer catalog.

4.2 - Apache Tomcat Server

Download the latest Apache Tomcat server (ver 8.5.58 at time of writing for Windows and Linux systems) and following installation instructions. Installation packages for RHEL (v8.x), Debian (v10.x), UBUNTU (v20.04), SLES (v15), and Alpine (V3.x) distributions are available.

Installation scripts for each installation type are available and should be run prior to installation.

Authentication Framework

Elytron is a component of JBOSS, an authentication framework which handles all authentication duties for the webserver, application server, and management functions. This framework allows the user to seamlessly login to services using the mobile app or website. All functionality is controlled by the Application Server administrator. See Figure 3 for overview.

Figure 3 - Authentication Implementation

SB Designs 1 Main Street
www.sbdesigns.io LLC Page 8 of 69

5 - SOFTWARE ARCHITECTURE

5.1 - General principles

The overall software architecture is separated into front and back-end, with layers or tiers of functionality, see Figure 1. The front end is facing the end users, while the backend acts to support the front end, both functionally and with data.

Project sources and versions are managed by Git, dependencies and packaging by Maven/Grunt

5.1.1 - Layers

Application architecture is as follows:

- A **client** layer is responsible for presentation of information/data to the end user (client), via Mobile Application (Android and iOS), and via web page;
- an application (or business) layer: responsible for the business logic of the component;
 - a notification layer: manage notification events (such as order status, stock status, etc) for both Employees and Customers;
 - an **authentication** layer: Use Elytron framework to handle login authentication and access to specific application and data functions based on user credentials
- a data layer: implementation of the business objects model.

5.2 - Technology Stack

Proposal utilizes an n-tier architecture consisting of a client tier, a server tier, and a data tier. The client tier contains a PC client (running a standard web browser) and handheld devices. The server tier contains the Web Server and the Notifications server (a framework for managing notifications issued to handheld devices). The data tier consists of MySQL database and storage. See Figure 4 for Backend/Frontend differentiation.

Figure 4 - Backend/Frontend Details

SB Designs 1 Main Street
www.sbdesigns.io LLC Page 9 of 69

5.3 - Application Architecture

The Application Server acts as communication center for all activities, see Figure 5. Users access the Application Server via a Representational State Transfer (REST) API, using HTTP.protocol. Transactions via HTTP include POST, PUT (for creating and updating records), GET (for retrieving records/results), and DELETE commands. The Application Server communicates with the DBMS via a protocol dictated by the DBMS, which ultimately becomes SQL (Structured Query Language) commands which the database can process. The DBMS has no logical component and only stores/retrieves data. Logic for the overall system is contained in the Application Server. Refer to Figure 4 for the application stack diagram.

Figure 5 - Application Architecture Diagram

5.4 - Advantages of the Architecture

The backend includes a robust distributed computing platform which enables enhanced performance and allows for scalability.

The n-tier architecture allows for the encapsulation of business logic, shielding the client from the complexity of the backend system. Any given tier need not be concerned with the internal functional tasks of any other tier.

The following list is a summary of the advantages using an n-tier architectural design:

- Scalability: Hardware and software can be added to meet retailer requirements for each of the tiers.
- Maintainability: The separation of presentation, business logic, and data makes the software cleaner, more maintainable, and easier to modify.
- Platform independence: The code is written once but can run anywhere that Java can run.
- Cost effectiveness: Open source market-proven technology is utilized, while object-oriented design increases reusability for faster development and deployment.
- Ease of integration: The reuse of business objects and function allows for faster integration to enterprise subsystems. N-tier architecture has become an industry standard.
- High availability: Middleware is designed to run in a clustered environment or on a low-cost blade server.
- Endurance: Multi-tiered physically distributed architecture extends the life of the system.
- Flexibility: The system allocates resources dynamically based on the workload.

SB Designs 1 Main Street
www.sbdesigns.io LLC Page 11 of 69

5.5 - Technical Architecture Diagrams and Description

This section provides a high-level overview of the technical architecture. Figure 6 illustrates the major pieces of the typical three-tiered implementation. Descriptions follow the diagram.

Figure 6 - Architectural Implementation

Customers using mobile apps or the web site and client users at the shop communicate with the Application server via REST API using HTTP protocol (see section 5.3 above for more details). The JBOSS Application Server acts as a command center routing calls to and from users via HTTP commands to the Database server. In addition, the Application server carries out authentication and notification services, such as allowing shop staff access to data and methods which regular customers cannot access, and notifying customers of their order status changes.

The physical data model (Figure 7) indicates the data model used in the MySQL database. The database is conceptually broken into 3 zones:

- 1. **Users**, including customers (base Users Table), Employees (Employee table, inheriting from Users) and related user data, such as address (for both customers and employees) and Position (employees only).
- 2. **Order**, which includes the Order table proper, Payment table (with payment information for the order), OrderedItems table, containing the customer's order attributes, and the Store table, which contains store attributes which will process the order.
- 3. Pizza table, which serves as the entry point to Recipe and Recipeltems table, and related Ingredient and StockItem/Stock tables. The Stock table is also referenced to the Store for which stock it refers to.

Figure 7 - Application Physical Data Model Diagram

SB Designs 1 Main Street
www.sbdesigns.io LLC Page 13 of 69

5.6 - Client Applications

5.6.1 - Android app details

The OC Pizza Company application will run on devices running Android v8 and above. Apps are written using Android Studio IDE using Kotlin. Standard frameworks are used with no external dependencies.

5.6.2 - iOS app details

The OC Pizza Company application will run on devices running iOS/iPadOS version 12 and above. Apps are written using XCode IDE in Swift. Standard frameworks are used with no external dependencies (no Swift packages or 'CocoaPods'). Since iOS version 12 will be supported, apps will be written using standard UIKit framework, not SwiftUI, which requires iOS version 13 and above. SwiftUI can be used for later versions of the app when all users are using at least version 13. Since apps can use both SwiftUI and UIKit, the app can be transitioned to SwiftUI in stages.

5.6.3 - Web Application Details

The software stack is as follows:

- HTML/CSS/Javascript
- Apache Tomcat Webserver / JBoss application Server
- MySQL Database

SB Designs 1 Main Street
www.sbdesigns.io LLC Page 14 of 69

6 - SPECIFIC POINTS

6.1 - Resources

Relevant Links:

Apache Webserver: <u>Apache Tomcat Webserver</u>
JBOSS Application Server: <u>JBOSS Application Server</u>
Elytron Authentication Framework: Elytron Framework

MySQL Database: MySQL
Android Studio: Android Studio

Xcode: Xcode

Website: Visual Studio Code

6.2 - Development environment

Android Studio is used for Android development, while Xcode is used for iOS/iPadOS development. Website development uses Visaual Studio Code

6.3 - Packaging / delivery procedure

For Webserver, Application Server, Authentication Framework, and MySQL Database:

All packages for the project have downloadable binaries for easy installation. All installation files will be downloaded to the appropriate server and installed.

For Android apps:

Apps for users can be submitted to the Google play store: <u>Play Store</u> and deployed. Applications for use inhouse are similarly deployed using the Google play store, but distributed via an enterprise account <u>Play Store for Enterprise</u>.

For iOS Apps:

User Apps can be submitted to the iOS App Store: <u>App Store</u> and downloaded by users via the Apple App Store. For in house applications (that is, applications used by shop managers and others working at OC Pizza), the applications are deployed using an Apple Business Manager account <u>Apple Business Manager</u>.
